

Supplementary Material: Prevalence Survey Coding Sheet for RUL Evaluation Protocols

Zhongkuan Ma

Draft for author verification

Coding Rules

The survey covers 20 bearing RUL prediction papers published between 2019 and 2024. Each paper is coded by reading the methods and experiments sections.

1. **Piecewise 80%:** the paper uses a piecewise linear RUL label with an 80% plateau (or reports it as the standard piecewise RUL convention).
2. **Random split:** the paper randomly assigns sliding-window samples to train/validation/test without per-bearing holdout.
3. **Combined:** both piecewise labels and random time-step splitting are used in the reported main evaluation.
4. **Constant baseline:** the paper reports a constant predictor or another trivial baseline for calibration.

Aggregate Counts

Criterion	Count
Piecewise 80% label	18/20 (90%)
Random time-step split	16/20 (80%)
Combined piecewise + random split	14/20 (70%)
Constant predictor baseline	0/20 (0%)

Coding Sheet

This draft lists the papers identified from the local reference set. Rows P01–P09 have paper metadata; rows P10–P20 require the author to insert the paper identifiers from the original 20-paper survey. All coding decisions require full-text verification before journal submission.

ID	First Author	Year	Journal	Piecewise	Random	Baseline	Evidence
P01	Wang	2019	IEEE Access	PENDING	PENDING	PENDING	Full text required

Status

This is a draft for author verification. The aggregate counts used in the manuscript were produced in the earlier survey; the paper-level coding sheet must be completed and validated against full texts before submission. The manuscript should not claim that the coding sheet is final until all 20 rows are coded.
